AMPR status May 7 post flight

Submitted by flafontaine on Sat, 05/07/2011 - 22:49

• AMPR

Flight Date: Saturday, May 7, 2011 Status:

Yellow

AMPR status is almost the same as the last update. Saturation of both 37 H and V occurred and considerable noise at 85 V. Timing of these events may have improved but only very marginally. Concern for the long-term health of 85 H was noted during the later stages of the flight, For soil moisture interests 10 GHz H and V (and 19 H and V for general use) seems good. We'll continue to try and resolve the issues at the higher frequencies. Brightness temperature imagery follows.
